**Tips for Trouble-Free Taping**
Tape and Transparent Dressing Removal

Proper tape removal is critical in reducing the occurrence of skin trauma.

A. Tape strips
1. Loosen edges of tape. If necessary, press a small piece of tape onto a corner to start an edge of the tape.
2. Stabilize the skin with one finger. Remove tape “low and slow” in direction of hair growth, keeping it close to skin surface and pulled back over itself. Removing tape at an angle may result in blistering and should be avoided as soon as possible.

B. 3M™ Tegaderm™ Transparent Dressing

Stretch method
- Grasp one edge or catch a “corner” of the Tegaderm™ Dressing with a piece of tape.
- Gently lift edge.
- With other hand, place fingers on top of dressing to support skin.
- Gently stretch the Tegaderm™ Dressing straight out and parallel to skin. This will release the adhesion of the dressing to the skin. As the Tegaderm™ Dressing is loosened, you may either (1) alternately stretch and relax the dressing or (2) “walk” your fingers under the dressing to continue stretching it. With both approaches, one hand continually supports the skin adhered to the Tegaderm™ Dressing.
- Slowly peel dressing back over itself, “low and slow,” in direction of hair growth. Removing dressing at an angle will pull at the epidermis, increasing risk of mechanical trauma. As dressing is removed, continue supporting newly exposed skin.

Tape Application

• Tape should be applied without tension to clean, dry skin.
• A clipper may be used to remove hair, if necessary.
• To protect at-risk skin, 3M™ Cavilon™ No Sting Barrier Film may be applied and when thoroughly dry, tape may be applied over it.
• In general, do not encircle a limb completely with tape.
• If distention is anticipated, use a tape that stretches or a self-adherent wrap to secure the dressing or tubing.

A. General taping
Apply the tape without tension, gently but firmly stroking the surface to maximize adhesion. Tape should extend at least one-half inch beyond the dressing. Tape should not be pulled or stretched when applied. If swelling does occur, loosen and re-fasten or replace tape to relieve the tension.

B. When compression is needed
1. Place first section of tape without tension onto skin on one side of the dressing, gently pressing downward.
2. With one hand, secure tape on one edge of the dressing while slightly stretching next section of tape over the dressing.
3. Secure tape on opposite edge of the dressing.
4. Press remaining tape onto skin without tension. Compression should come from the multiple layers of dressing material, not from excessive tension in the tape. Skin distention under tape may result in blistering and should be relieved as soon as possible.

C. When distention is anticipated
Foil tapes generally stretch in all directions; however, non-woven soft cloth tapes, such as 3M™ Medipore™ Soft Cloth Tape, and 3M™ Medipore™ H Soft Cloth Tape have more stretch in the cross-direction and on the bias. The direction of the stretch should be considered when securing a dressing or tubing to an area that is at high risk for distention, edema, hematoma formation, or movement. Acrucially, applying soft cloth tape parallel to the incision appears to be associated with fewer skin tension injuries than taping perpendicular to the incision.

Reducing The Risk Of Superficial Skin Damage Related To Adhesive Use

Superficial skin damage can occur when adhesive products are used. Skin stripping and tension blisters are the most common problems associated with taping. Many of these injuries may be prevented by correct use including careful attention to skin preparation, choice of tape, and proper application and removal of tape. Less common types of skin damage are irritant contact dermatitis, allergic contact dermatitis, folliculitis and maceration. A small percentage of individuals may experience hypopigmentation or hyperpigmentation of the skin following the removal of an adhesive product. Similar problems may occur with skin closure strips.

Problem Cause To reduce the risk of injury

<table>
<thead>
<tr>
<th>Problem</th>
<th>Cause</th>
<th>To reduce the risk of injury</th>
</tr>
</thead>
</table>
| Stripping                | A partial thickness injury occurring when adhesive bond between tape and skin is greater than the bond between epidermis and dermis. As tape is removed, the epidermis remains adhered to the adhesive, resulting in epidermal damage or a painful area of exposed dermis. Degree of stripping varies with skin condition, characteristics, and frequency of taping. | • Use gentle, hypoallergenic tape
• Match strength of adhesive to clinical needs and skin condition
• Apply tape to clean, dry skin
• For high risk patients, avoid using skin tackifiers under tape
• Protect skin with 3M™ Cavilon™ No Sting Barrier Film allowing it to dry before taping
• If tampered is anticipated, consider applying tape over a platform
• Use proper removal technique |
| Mechanical Injury Due To Tension | The most common causes of tension injury are inappropriate taping and distention of skin under an unyielding tape. Strapping tape across skin is mistakenly thought to increase adhesion. As the taping begins to exert force, the skin pulls from under the tape, and the epidermis is peeled from the skin. Skin tears may occur before a blister forms. Tension injuries may also occur when edema, hematoma formation, or distention distorts the skin surface or when a joint or other area of movement is covered with a taping tape. |
| Non-Allergic Contact Dermatitis | A non-allergic contact dermatitis may result when chemical irritants such as tackifiers or some skin preparations are trapped between adhesive and skin. The affected area will correlate to the area of exposure and may appear reddened, swollen, blistered, or weeping. |
| Allergic Contact Dermatitis | Allergic reactions may be mediated-immune responses to a particular component of the adhesive and become evident intraoperatively. Patients may be mistakenly identified as having tape allergies when, in fact, they have experienced a non-allergic contact dermatitis. Signs include well-defined areas of erythema and edema; vesicles may be present, as well as small erosions. |
| Folliculitis | Folliculitis is an inflammation of the hair follicle caused by shaving or entrapment of bacteria. |
| Maceration | Maceration refers to skin changes seen when moisture is trapped against the skin for a prolonged period. The skin will turn white or gray, soften and wrinkles. Macerated skin is more permeable and prone to damage from friction and irritants. | • Use a clipper or depilatory preparation if hair removal is necessary
• Apply tape without tension
• Identify patients at high-risk, fragile skin, medical conditions (e.g., long-term corticosteroid use, malnourishment or surgical procedures where edema or distortion is expected (abdominal, orthopedic))
• Protect skin with 3M™ Cavilon™ No Sting Barrier Film
• If swelling or movement is expected, use a tape that stretches. Apply tape so direction of stretch corresponds with direction of swelling
• If desired, compression may be obtained by carefully stretching tape over a dressing while securing the tape to the skin without tension
• If distention or edema is noted, loosen, remove, or replace tape
| | | • Assure that skin is clean and dry before applying tape
• Protect skin with 3M™ Cavilon™ No Sting Barrier Film allowing it to dry before applying tape
• If possible, avoid using tackifiers |
| | | • Using the type of tape causing sensitivity
• Options may include identifying an alternative hypoallergenic tape or contacting tape manufacturer for assistance
• Use 3M™ Cavilon™ No Sting Barrier Film |
| | | • Identifying type of tape causing sensitivity
• Options may include identifying an alternative hypoallergenic tape or contacting tape manufacturer for assistance
• Use 3M™ Cavilon™ No Sting Barrier Film |
| | | • Change dressing or tubing to a non-irritant substitute
• Use breathable tape in moist areas
• Replace tape if soiled
• Use sterile tape in areas with moisture
• Avoid occlusive tapes unless clinically indicated
• Use a clipper or depilatory preparation if hair removal is necessary
• Protect skin with 3M™ Cavilon™ No Sting Barrier Film |

• Use proper removal technique
**Tape Application**

- Tape should be applied without tension to clean, dry skin.
- A clipper may be used to remove hair, if necessary.
- To protect at-risk skin, 3M™ Tegaderm™ Transparent Dressing may be applied and when thoroughly dry, tape may be applied over it.
- In general, do not encircle a limb completely with tape.
- If distention is anticipated, use a tape that stretches or a self-adherent wrap to secure the dressing or tubing.

**Tape and Transparent Dressing Removal**

Proper tape removal is critical in reducing the occurrence of skin trauma.

**A. Tape strips**
1. Loosen edges of tape. If necessary, press a small piece of tape onto a corner to start an edge of the tape.
2. Gently lift the edge of dressing with your fingers. Do not pull on the edge of the dressing to remove the tape.
3. Carefully remove tape in the direction of hair growth. As tape is removed, continue supporting newly exposed skin.

**B. 3M™ Tegaderm™ Transparent Dressing**

- Grasp one edge or catch a “corner” of the Tegaderm™ Dressing with a piece of tape.
- Gently lift edge of dressing.
- With other hand, place fingers on top of dressing to support skin.
- Gently stretch the Tegaderm™ Dressing straight out and parallel to skin. This will release the adhesion of the dressing to the skin. As the Tegaderm™ Dressing is loosened, you may either (1) alternately stretch and relax the dressing or (2) “walk” your fingers under the dressing to continue stretching it. With both approaches, one hand continually supports the skin adhered to the Tegaderm™ Dressing.
- Slowly peel dressing back over itself, “low and slow,” in direction of hair growth. Removing dressing at an angle will pull at the epidermis, increasing risk of mechanical trauma. As tape is removed, continue supporting newly exposed skin.

**Reducing The Risk Of Superficial Skin Damage Related To Adhesive Use**

Superficial skin damage can occur when adhesive products are used. Skin stripping and tension blisters are the most common problems associated with taping. Many of these injuries may be prevented by correct use including careful attention to skin preparation, choice of tape, and proper application and removal of tape. Less common types of skin damage are irritant contact dermatitis, allergic contact dermatitis, folliculitis and maceration. A small percentage of individuals may experience hypogamipergination or hypopigmentation of the skin following the removal of an adhesive product. Similar problems may occur with skin closure strips.

<table>
<thead>

<th>To reduce the risk of injury</th>
</tr>
</thead>
</table>
| Stripping                        | A partial thickness injury occurring when adhesive bond between tape and skin is greater than the bond between epidermis and dermis. | • Use gentle, hypoallergenic tape  
• Match strength of adhesive to clinical needs and skin condition  
• Apply tape to clean, dry skin  
• For high risk patients, avoid using skin tackifiers under tape  
| Mechanical Injury Due To Tension | The most common causes of tension injury are inappropriate stripping of tape during application and detachment of skin under an undetachable tape. Strapping tape across skin is mistakenly thought to increase adhesion. As the backing resists stretch or regains its original shape, the epidermis begins to lift. This results in “tension blisters” typically seen at ends of the tape. Skin tears may occur before a blister even forms. Tension injuries may also occur when edema, hemotma formation, or distention distort the skin surface or when a joint or other area of movement is covered with an undetachable tape. | • Apply tape without tension  
• Identify patients at high risk: fragile skin, medical conditions (e.g., long-term constestational use, malnutrition or surgical procedures where edema or distention is expected (abdominal, orthopedic))  
• Protect skin with 3M™ Cavilon™ No Sting Barrier Film  
| Non-Allergic Contact Dermatitis  | A non-allergic contact dermatitis may result when chemical irritants such as tackifiers or some skin preparations are trapped between adhesive and skin. The affected area will become red and may be tender, swollen, blistered, or weeping. | • Protect skin with 3M™ Cavilon™ No Sting Barrier Film allowing it to dry before applying tape  
• If possible, avoid using tackifiers  

**Folliculitis**

Folliculitis is an inflammation of the hair follicle caused by shaving or entrapment of bacteria.

- Use a clipper or depilatory preparation if hair removal is necessary

**Maceration**

Maceration refers to skin changes seen when moisture is trapped against the skin for a prolonged period. The skin will turn white or gray, puffy and wrinkled. Macerated skin is more permeable and prone to damage from friction and irritants.

- Keep taped skin clean and dry  
- Replace tape if soiled  
- Use breathable tape in moist areas  
- Avoid occlusive tapes unless clinically indicated
