

## Amoena Energy Cosmetic Breast Form

Here's a fact: No one wants to sweat behind her breast form. Now women have a more natural-looking solution to this common dilemma: the Amoena Energy Cosmetic breast form.

The 2015 addition to the Amoena breast form portfolio features the well-known temperature-equalizing technology of Comfort+, which pulls heat away from your body and stores it inside the form, as well as a raised-pearl design on the back, which encourages airflow around the form. It's a perfect choice if she:

- Lives in a warmer climate.
- Works out everyday/regularly or is very active.
- Experiences hot flashes due to early menopause triggered by chemo.

### Results after Researches

In fact, a study published in the journal Orthopädie-Technik in November of 2014 offers several proof points that Amoena Energy breast forms perform better than other manufacturers' breast forms when under heated conditions. Dr. Dirk Muscat of the University of Applied Sciences, Rosenheim (Germany) conducted research using infrared cameras to show where heat occurs after a period of time, and how well the breast form holds heat inside, away from your body (see figures 1-4).

**Figure.1**

Infrared imaging shows two breast forms, the Amoena Energy on the left and another manufacturer's on the right, after being heated for 30 minutes. The blue area on the Amoena form shows that the temperature has stayed lower, compared to the competitor's form.

**Figure.2**

After heating 60 minutes. On the left you can see that the temperature of the Energy Breast Form is much cooler (green area) than the other brand.

**Figure.3**

The forms have been heated for 100 minutes; this image shows the starting point for the cooling test.

**Figure.4**

After 20 minutes of cooling, the Amoena Energy form is holding more heat inside (and therefore is warmer) than the other form; in other words, the Energy form is not distributing heat quickly back to the wearer's chest.

## Women love it

Energy Cosmetic boasts another superior feature, as well: A very thin “cosmetic” layer of soft, standard silicone on the front that looks so real, even in the sheerest bras, it’s nearly invisible and very difficult to tell it apart from a natural breast. Like the Natura Cosmetic breast form, it features the reduced weight, InTouch soft silicone on the inside combined with the natural front layer: Making the form move and feel like a natural breast.
